# Pattern avoidance in rook monoids

Dan Daly (Southeast Missouri State University)

**Lara Pudwell** (Valparaiso University)

Special Session on Patterns in Permutations and Words

Joint Mathematics Meetings 2013

San Diego, California

January 12, 2013

## Definition

Let  $n \in \mathbb{N}$ . The *rook monoid*  $\mathcal{R}_n$  is the set of all  $n \times n$   $\{0, 1\}$ -matrices such that each row and each column contains at most one 1.

Example members of  $\mathcal{R}_7$ :

$$\begin{bmatrix} 0 & 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 0 & 0 & 1 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 & 0 & 0 \\ 1 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 & 0 \end{bmatrix}$$

$$\begin{bmatrix} 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 \end{bmatrix}$$

$$\begin{bmatrix} 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 1 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 & 0 \end{bmatrix}$$

Notice:  $n \times n$  permutation matrices are a submonoid of  $\mathcal{R}_n$ .

## Rook Placements

to other  
objects

### Conclusion

- Have an  $n \times n$  grid.
- Place  $k$  rooks ( $0 \leq k \leq n$ ) in non-attacking position.  
(No more than one rook in each row, no more than one rook in each column).

patterns

Other patterns

### 2d Avoidance

Connections  
to other

objects

### Conclusion

Known: How many ways can we place  $k$  rooks on an  $n \times n$  grid?

- $r_{n,k} = \binom{n}{k}^2 k!$

- $\sum_{n=0}^{\infty} R_n(1) \frac{x^n}{n!} = \frac{e\left(\frac{x}{1-x}\right)}{1-x}$

Sequence: 2, 7, 34, 209, 1546, 13327, ... (OEIS A002720)

New question: How many ways can we place  $k$  rooks on an  $n \times n$  grid so they *avoid* a given smaller rook placement pattern?

# Rook Strings

Pattern  
avoidance in  
rook monoids

objects

## Conclusion

Given an  $n \times n$  rook placement, associate a string  $r_1 \cdots r_n$  such that:

- If there is a rook in column  $i$ , row  $j$ , then  $r_i = j$ .
- If column  $i$  is empty, then  $r_i = 0$ .

2473156

0000000

3105006

## Definition

Given a rook pattern  $q \in \mathcal{R}_m$  and any element  $r \in \mathcal{R}_n$ ,  $r$  *contains*  $q$  if there exist  $1 \leq i_1 < \cdots < i_m \leq n$  such that:

- $q_j = 0$  if and only if  $r_{i_j} = 0$
- The nonzero members of  $r_{i_1} \cdots r_{i_m}$  are order-isomorphic to the non-zero entries of  $q$ .

Otherwise  $r$  *avoids*  $q$ .

Example:  $3402 \in \mathcal{R}_4$

- contains 0, 1, 01, 10, 12, 21, 201.
- avoids 102.

- $\mathcal{R}_n(q) = \{r \in \mathcal{R}_n \mid r \text{ avoids } q\}$
- $\mathcal{R}_{n,k}(q) = \{r \in \mathcal{R}_n \mid r \text{ avoids } q, r \text{ has } k \text{ nonzero entries}\}$
- $r_n(q) = |\mathcal{R}_n(q)|$
- $r_{n,k}(q) = |\mathcal{R}_{n,k}(q)|$

For example:

- $\mathcal{R}_2(01) = \{00, 10, 20, 12, 21\}$
- $\mathcal{R}_{2,0}(01) = \{00\}$
- $\mathcal{R}_{2,1}(01) = \{10, 20\}$
- $\mathcal{R}_{2,2}(01) = \{12, 21\}$
- $r_2(01) = 5, r_{2,0}(01) = 1, r_{2,1}(01) = 2, r_{2,2}(01) = 2$

# The pattern $0 \cdots 0$

All 0/No 0  
patterns

Other patterns

## 2d Avoidance

Connections  
to other  
objects

## Conclusion

$r$  avoids  $\underbrace{0 \cdots 0}_j$

$\iff r$  has at most  $j - 1$  0s.

$\iff r$  has at least  $n - j + 1$  nonzero entries.

$$r_{n,k}(\underbrace{0 \cdots 0}_j) = \begin{cases} r_{n,k} = \binom{n}{k}^2 k! & k \geq n - j + 1 \\ 0 & k < n - j + 1 \end{cases}$$

## The pattern $0 \cdots 0$

Pattern  
avoidance in  
rook monoids

Lara Pudwell

### Definitions

Rook Monoids  
Avoidance

### 1d Avoidance

All 0/No 0  
patterns

Other patterns

### 2d Avoidance

Connections  
to other  
objects

### Conclusion

$$r_n(\underbrace{0 \cdots 0}_j) = \sum_{k=n-j+1}^n \binom{n}{k}^2 k!$$

In particular:

$$r_n(0) = \sum_{k=n}^n \binom{n}{k}^2 k! = n!$$

$$r_n(00) = \sum_{k=n-1}^n \binom{n}{k}^2 k! = (n+1)!$$

## The pattern $0 \cdots 0$

Pattern  
avoidance in  
rook monoids

Lara Pudwell

### Definitions

Rook Monoids  
Avoidance

### 1d Avoidance

All 0/No 0  
patterns

Other patterns

### 2d Avoidance

Connections  
to other  
objects

### Conclusion

$$r_n(\underbrace{0 \cdots 0}_j) = \sum_{k=n-j+1}^n \binom{n}{k}^2 k!$$

In particular:

$$r_n(0) = \sum_{k=n}^n \binom{n}{k}^2 k! = n!$$

$$r_n(00) = \sum_{k=n-1}^n \binom{n}{k}^2 k! = (n+1)!$$

In general for fixed  $j$

$$\sum_{n=0}^{\infty} r_n(\underbrace{0 \cdots 0}_j) \frac{x^n}{n!} = \sum_{i=1}^j \frac{x^{i-1}}{(i-1)!(1-x)^i}$$

Consider  $\rho \in \mathcal{S}_j$ .

Then  $r_{n,k}(\rho) = \binom{n}{k}^2 s_k(\rho)$  and  $r_n(\rho) = \sum_{k=0}^n \binom{n}{k}^2 s_k(\rho)$

Consider  $\rho \in \mathcal{S}_j$ .

Then  $r_{n,k}(\rho) = \binom{n}{k}^2 s_k(\rho)$  and  $r_n(\rho) = \sum_{k=0}^n \binom{n}{k}^2 s_k(\rho)$

We have:

$$r_n(1) = \sum_{k=0}^n \binom{n}{k}^2 s_k(1) = \binom{n}{0} s_0(1) = 1$$

$$r_n(12) = r_n(21) = \sum_{k=0}^n \binom{n}{k}^2 = \binom{2n}{n} \text{ (OEIS A000984)}$$

For  $\rho \in \mathcal{S}_3$ ,

$$r_n(\rho) = \sum_{k=0}^n \binom{n}{k}^2 C_k \text{ where } C_k = \frac{\binom{2k}{k}}{(k+1)} \text{ (OEIS A086618)}$$

Rook patterns of length 3 or less include:

- 0,1
- 00, 01, 10, 12, 21
- 000, 001, 010, 100, 012, 102, 120, 021, 201, 210, 123, 132, 213, 231, 312, 321

Rook patterns of length 3 or less include:

Conclusion

- Have *enumeration scheme* algorithm programmed in Maple
  - Input: set of rook patterns
  - Output: encoding for system of recurrences enumerating rook placements avoiding those patterns
  - Recurrence determined completely algorithmically
  - Once a scheme is found, can compute  $r_n(p)$  and  $r_{n,k}(p)$  for  $n$  as large as 30 or 40.
- Using scheme data, have determined closed form for
$$\sum_{n=0}^{\infty} r_n(0 \cdots 0) \frac{x^n}{n!} \text{ and } \sum_{n=0}^{\infty} r_n(0 \cdots 01) \frac{x^n}{n!}.$$

### Conclusion

## Definition

Rook placement  $R$  (on an  $n \times n$  board) contains rook placement  $r$  (on a  $m \times m$  board) if there exist  $m$  rows and  $m$  columns of  $R$  such that

- If  $R$  is restricted to those  $m$  columns, the empty columns equal the empty columns of  $r$ .
- If  $R$  is restricted to those  $m$  rows, the empty rows equal the empty rows of  $r$ .
- $R$  restricted to those  $m$  rows and  $m$  columns is equal to  $r$ .

Example:

contains

and

but avoids

### Notation

$r_n^*(p)$  is the number of  $n \times n$  rook placements avoiding pattern  $p$  in the 2-dimensional sense.

Note:  $r_n^*(p) = r_n(p)$  if  $p$  has all 0s or  $p$  has no 0s.

$r_n^*(p)$  for small 2-dimensional rook patterns

| $p \setminus n$ | 1 | 2 | 3  | 4   | 5    | 6     | OEIS    |
|-----------------|---|---|----|-----|------|-------|---------|
| 01              | 2 | 6 | 23 | 108 | 605  | 3956  | A093345 |
| 001             | 2 | 7 | 33 | 191 | 1299 | 10119 | new     |
| 012             | 2 | 7 | 31 | 159 | 921  | 5988  | new     |
| 102             | 2 | 7 | 31 | 159 | 916  | 5859  | new     |

- $r_n(321) = r_n^*(321) = \sum_{k=0}^n \binom{n}{k}^2 C_k$  (OEIS A086618)

- Is equal to the number of permutations of length  $2n$  which avoid the pattern 4321 and are invariant under the reverse-complement map (Egge, 2010).
- Have bijective proof.

# Signed pattern avoidance

## Conclusion

$r_n^* \left( \begin{array}{|c|c|} \hline & \\ \hline & \bullet \\ \hline \end{array} \right)$  is the number of  $\{12, \bar{2}1\}$ -avoiding signed permutations (studied by Mansour and West in 2002).

Example:  $r_2^* \left( \begin{array}{|c|c|} \hline & \\ \hline & \bullet \\ \hline \end{array} \right) = 6$

The six  $\{12, \bar{2}1\}$ -avoiding signed permutations are:

$$\bar{1}2, \quad 1\bar{2}, \quad \bar{1}\bar{2}, \quad 21, \quad 2\bar{1}, \quad \bar{2}1$$

## 2d Avoidance

Connections  
to other  
objects

## Conclusion

- $r_n(000) = r_n^*(000) = \frac{(n+2)!}{4} + \frac{n!}{2}$  (OEIS A006595)
  - OEIS: this is number of  $A$ -reducible ( $\overline{12}$  and  $\overline{132}$  avoiding) elements of  $B_n$  (Stembridge, 1997).
  - Have bijective proof.

- Rook monoids provide a natural generalization of permutations.
- The enumeration of rook placements is well-known, but pattern-avoiding rook placements provide a plethora of new enumeration questions.
- Rook placements avoiding one-dimensional patterns can be enumerated via automated enumeration schemes.
- Less is known about two-dimensional avoidance.
- Connections exist to special cases of other pattern-avoidance problems.
