Table S1 List of 34 severity domains

	Severity domain	Hierarchical domain	Binary domain
Diabetes-related complications and renal disease domains	1. Diabetic neuropathy	√	Combined with 2, 5, 8
	2. Foot ulcers and Charcot foot	√	Combined with 1, 5, 8
	3. Gangrene	√	√
	4. Amputation	√	√
	5. Diabetic retinopathy	√	Combined with 1, 2, 8
	6. Laser therapy (including laser photocoagulation)	√	√
	7. Low vision, blindness	√	√
	8. Diabetic nephropathy	√	Combined with 1,2, 5
	9. Albuminuria, proteinuria	√	√
	10. ESRD (end stage renal disease): kidney transplant and dialysis	√	√
	11. Hypoglycaemia	√	√
	12. Diabetic ketoacidosis (DKA)	√	√
	13. Hyperosmolar hyperglycaemic state (HHS)	√	√
Cerebrovascular and cardiovascular disease, risk factors and interventions domains	14. Hypertension	√	√
	15. Hyperlipidaemia	√	√
	16. Stable angina	√	√
	17. Myocardial infarction (MI), acute coronary syndrome (ACS), unstable angina	√	√
	18. Heart valve disease	√	√
	19. Heart valve interventions	√	√
	20. Endocarditis	√	√
	21. Coronary artery interventions (percutaneous coronary intervention (PCI)/ percutaneous transluminal coronary angioplasty (PTCA), coronary artery bypass graft (CABG))	√	Combined with 33
	22. Cardiac arrest (ventricular tachycardia/fibrillation (VT/VF), Asystole)	√	√
	23. Atrial fibrillation (AF), supraventricular tachycardia (SVT)	√	√
	24. Pacemaker	√	√
	25. Heart failure (HF)	√	√
	26. Defibrillator, implantable cardioverter defibrillator (ICD), Cardiac resynchronization therapy (CRT) use	√	√
	27. Peripheral vascular disease (PWD)	√	√
	28. Cardiomyopathy	√	√
	29. Pericardial disease	√	√
	30. Myocarditis	√	√
	31. Coronary heart disease (CHD)	√	√
	32. Transient ischemic attack (TIA)	√	Combined with 34
	33. Carotid artery events, stenting and bypass interventions	√	Combined with 21
	34. Stroke	√	Combined with 32

Table S2 Assigned hierarchical weights

	Severity domain	Hierarchical weight
Diabetes-related complications and renal disease domains	1. Diabetic neuropathy	1
	2. Foot ulcers and Charcot foot	1
	3. Gangrene	2
	4. Amputation	3
	5. Diabetic retinopathy	1
	6. Laser therapy (including laser photocoagulation)	2
	7. Low vision, blindness	2
	8. Diabetic nephropathy	1
	9. Albuminuria, proteinuria	2
	10. ESRD (end stage renal disease): kidney transplant and dialysis	3
	11. Hypoglycaemia	1
	12. Diabetic ketoacidosis (DKA)	2
	13. Hyperosmolar hyperglycaemic state (HHS)	3
Cerebrovascular and cardiovascular disease, risk factors and interventions domains	14. Hypertension	0.5
	15. Hyperlipidaemia	0.5
	16. Stable angina	1
	17. Myocardial infarction (MI), acute coronary syndrome (ACS), unstable angina	2
	18. Heart valve disease	1
	19. Heart valve interventions	2
	20. Endocarditis	2
	21. Coronary artery interventions (percutaneous coronary intervention (PCI)/ percutaneous transluminal coronary angioplasty (PTCA), coronary artery bypass graft (CABG))	2
	22. Cardiac arrest (ventricular tachycardia/fibrillation (VT/VF), Asystole)	3
	23. Atrial fibrillation (AF), supraventricular tachycardia (SVT)	1
	24. Pacemaker	2
	25. Heart failure (HF)	3
	26. Use of defibrillator, implantable cardioverter defibrillator (ICD), Cardiac resynchronization therapy (CRT)	4
	27. Peripheral vascular disease (PWD)	1
	28. Cardiomyopathy	1
	29. Pericardial disease	1
	30. Myocarditis	1
	31. Coronary heart disease (CHD)	1
	32. Transient ischemic attack (TIA)	2
	33. Carotid artery events, stenting and bypass interventions	3
	34. Stroke	4

Supplementary data to "Development and validation of the DIabetes Severity SCOré (DISSCO)". Zghebi et al.

Table S3 Number of type 2 diabetes cases (%) by annual bins with baseline HbA_{1c} recorded within one year before and six months post-index (training and validation datasets)

	Up to 03/2008	Up to 03/2009	Up to 03/2010	Up to 03/2011	Up to 03/2012	Up to 03/2013	Up to 03/2014	Up to 03/2015	Up to 03/2016	Up to 03/2017
Training dataset										
Total number of cases	56,101	60,459	65,141	69,259	72,740	76,391	79,395	80,433	80,485	79,649
Number (%) of cases with recorded HbA_{1c}	45,940 (82%)	50,445 (83%)	55,231 (85%)	59,485 (86%)	63,085 (87%)	66,989 (88%)	70,198 (88%)	71,554 (89%)	72,068 (90%)	71,551 (90%)
Validation dataset										
Total number of cases	14,021	15,064	16,270	17,287	18,172	19,213	19,893	20,075	20,110	19,917
Number (%) of cases with recorded HbA_{1c}	11,489 (82%)	12,586 (84%)	13,801 (85%)	14,845 (86%)	15,759 (87%)	16,834 (88%)	17,590 (88%)	17,832 (89%)	17,973 (89%)	17,870 (90%)

Rationale for the chosen window to measure baseline HbA_{1c}: The one year before and six months after index date window was decided after examining the longitudinal patterns of recorded HbA_{1c} data and the number of cases with missing HbA_{1c} data in different windows before and after index date. Given the relevance of HbA_{1c} to our developed severity measure, we refrained from assigning individuals with missing HbA_{1c} to an "Unknown" category and preferred to supplement missing HbA_{1c} data by extending to measurements recorded within 6 months of post-index window i.e. using the closest measure recorded within a limited interval (one year before and six months after index date) instead. This approach can be justified by available data indicating that HbA_{1c} is fairly stable in people with type 2 diabetes, and that some cases were not first diagnosed with type 2 diabetes as a result of an HbA_{1c} testing (especially for early year cases and before HbA_{1c} test was approved for diabetes diagnosis in 2011 (BMJ 2012;345:e729), cases diagnosed due to opportunistic screening or while managing another health condition. But we would expect HbA_{1c} tests to be recorded afterwards, ideally, within the first 3-6 months of diabetes diagnosis.

C10 severity score categories (0 - ≥6) are based on the simple count of severity domains using 10-year look-back window. Cell counts of less than five individuals can not be disclosed and are presented as <5 throughout the table. *most recent HbA_{1c} measure within 1year before or 6months after index date. **counts are merged with the Q5 band as they were less than 5 individuals.

ACS: acute coronary syndrome; **AF:** atrial fibrillation; **CHD:** coronary heart disease; **CHF:** congestive heart failure; **ESRD:** end stage renal disease; **HbA_{1c}:** glycated haemoglobin. **IMD:** index of multiple deprivation; **MI:** myocardial infarction; **PVD:** peripheral vascular disease; **SD:** standard deviation; **SVT:** supraventricular tachycardia; **TIA:** transient ischemic attack.

Figure S1 Diagram of the look-back windows of pre-index and moving post-index time points

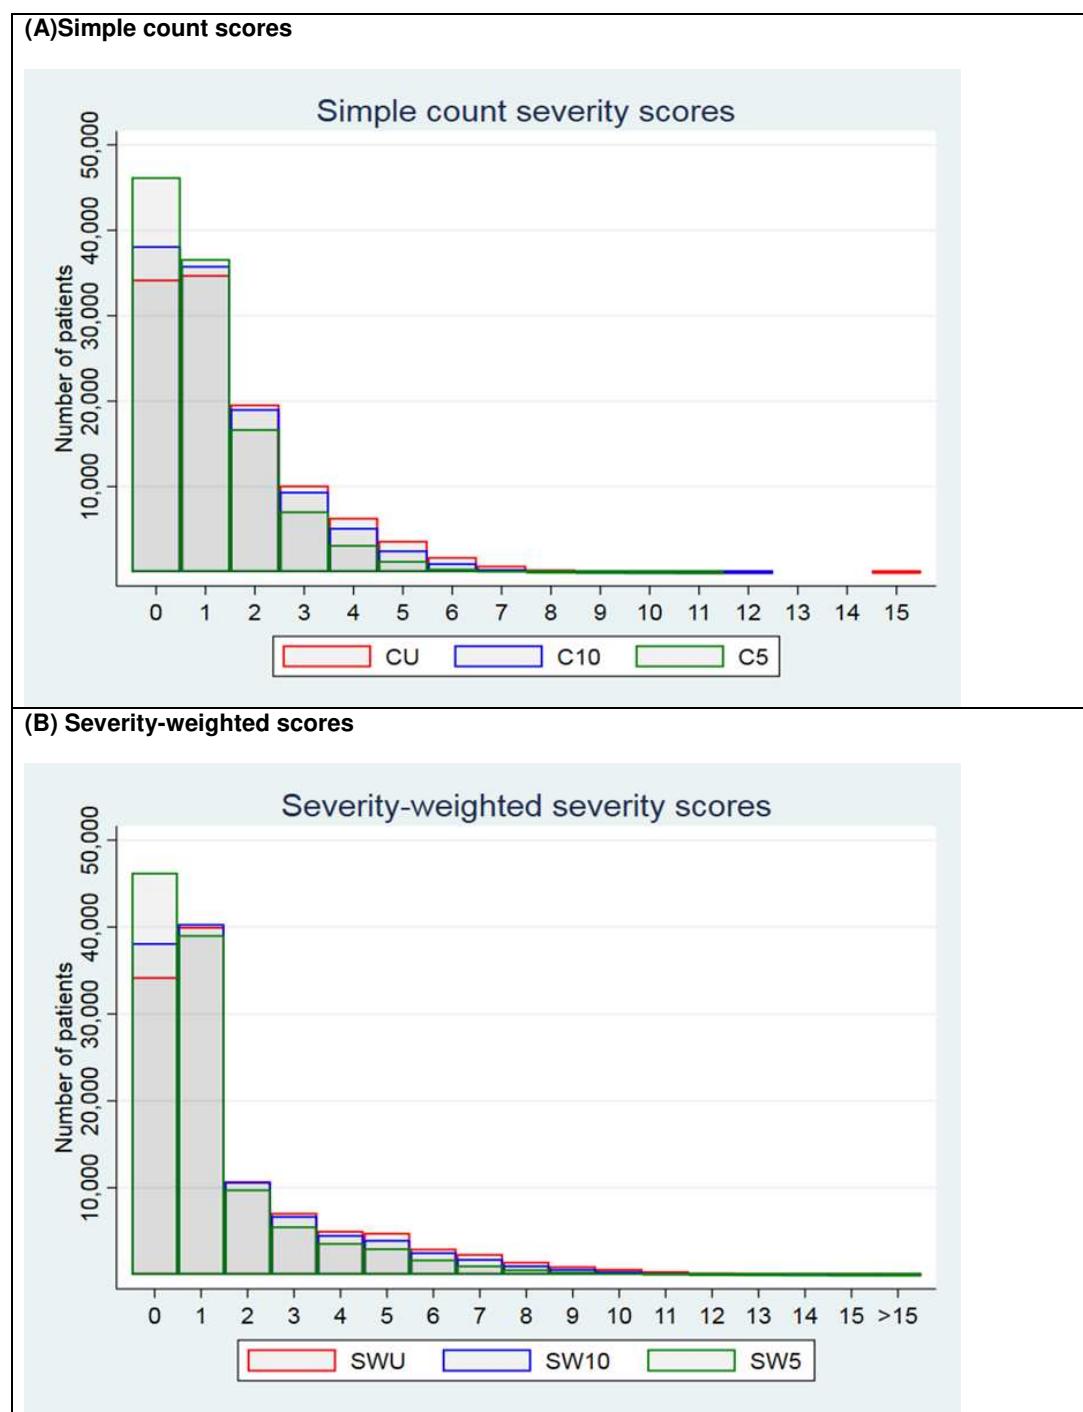

Three look-back windows were used to look-back window, defining the time-period within which events had to occur for inclusion in the severity score calculation. We examined three lengths of look-back windows: unlimited (events at any time in the patient's pre-index record); up to 10 years before index date; and up to 5 years before index date. We calculated moving post-index severity scores allowing the window within which events could occur to range from 1 to 5 years after the index date, each coupled with three look-back windows. For example, the 10-year look-back window incorporating 3 years post-index (represented by the blue dash-dot line), ranged from seven years prior to the index year to three years afterwards

Unlimited look-back window
Up to 10-year look-back window
Up to 5-year look-back window

Supplementary data to "Development and validation of the DIabetes Severity SCOré (DISSCO)". Zghebi et al.

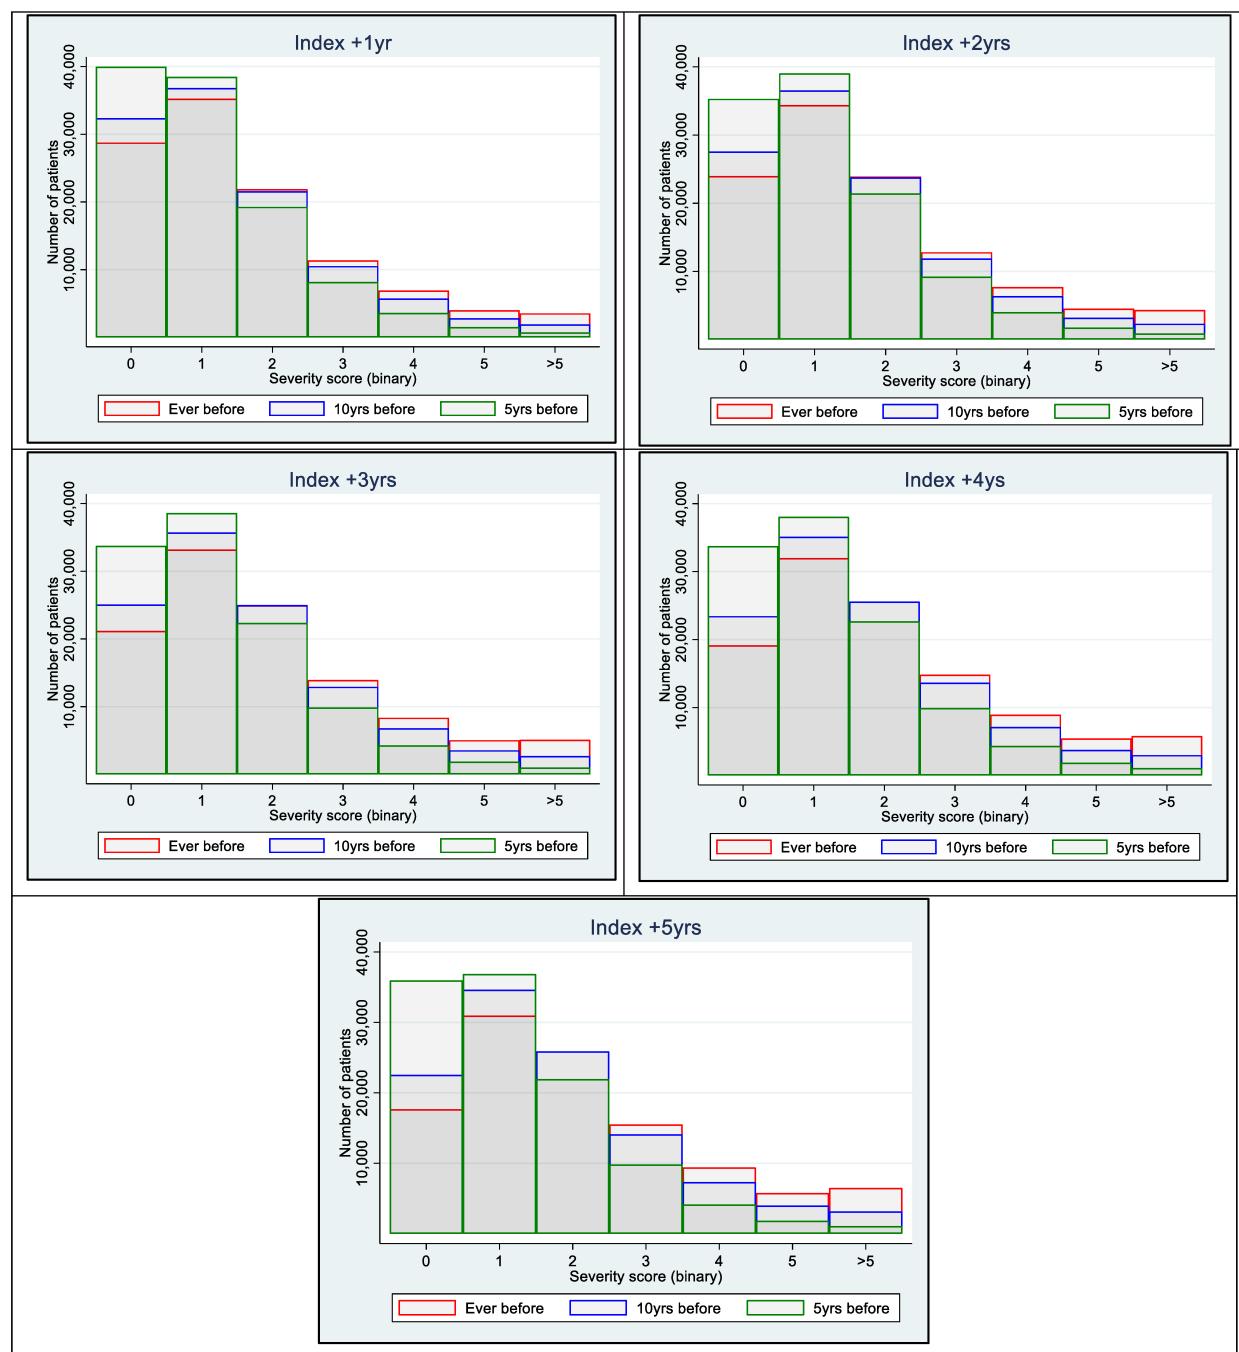

Figure S2. Patients count by (A) simple count and (B) severity-weighted scores at three look-back time windows (training dataset)

Simple count (C) or severity-weighted (SW) score measured using unlimited (CU/SWU), 10-year (C10/SW10), and 5-year (C5/SW5) look-back pre-index windows, respectively. Simple count: equals the total severity domains by assigning equal weighting (weight=1) to all domains in the overall score. Severity-weighted score: by assigning a weight to each of the severity domains according to a hierarchy of increased severity based on clinical judgement.
