Edited by W. T. A. Harrison, University of Aberdeen, Scotland

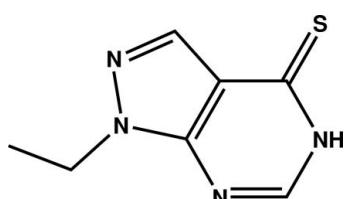

In the title compound, C<sub>7</sub>H<sub>8</sub>N<sub>4</sub>S, the methyl C atom is displaced by 1.232 (7) Å from the mean plane of the pyrazolo[3,4-*d*]pyrimidine ring system (r.m.s. deviation = 0.007 Å). The N—N—C—C<sub>m</sub> (m = methyl) torsion angle is −60.3 (6)°. In the crystal, molecules are linked by N—H···S hydrogen bonds, generating [010] chains, which are reinforced by C—H···N interactions. The chains are cross-linked by weak C—H···S hydrogen bonds, generating (001) sheets.

**Keywords:** crystal structure; pyrazolo[3,4-*d*]pyrimidine; biological activity; hydrogen bonding.

## Crystal structure of 1-ethylpyrazolo[3,4-*d*]pyrimidine-4(5*H*)-thione

**Mohammed El Fal, Youssef Ramli, El Mokhtar Essassi, Mohamed Saadi and Lahcen El Ammari**

### S1. Comment

Pyrazolo [3,4-*d*] pyrimidine derivatives have attracted considerable attention from researchers due to their bioactive and pharmaceutical properties. Many members of this family are widely used as antiviral (Rashad *et al.*, 2008); anti-mycobacterial (Ballell *et al.* 2007) and anticancer agents (Rashad *et al.* 2011). The present paper is a continuation of our research work devoted to the development of pyrazolo [3,4-*d*] pyrimidine derivatives with potential pharmacological activities (El Fal *et al.*, 2013; Radi *et al.*, 2013; Alsubari *et al.*, 2011).

The molecule of the title compound is build up from two fused five- and six-membered heterocycles linked to an ethyl group and to S atom as shown in Fig.1. The pyrazolo[3,4-*d*]pyrimidine ring is nearly perpendicular to the ethyl group as indicated by the torsion angle C7C6N3N4 of -60.3 (6) $^{\circ}$ .

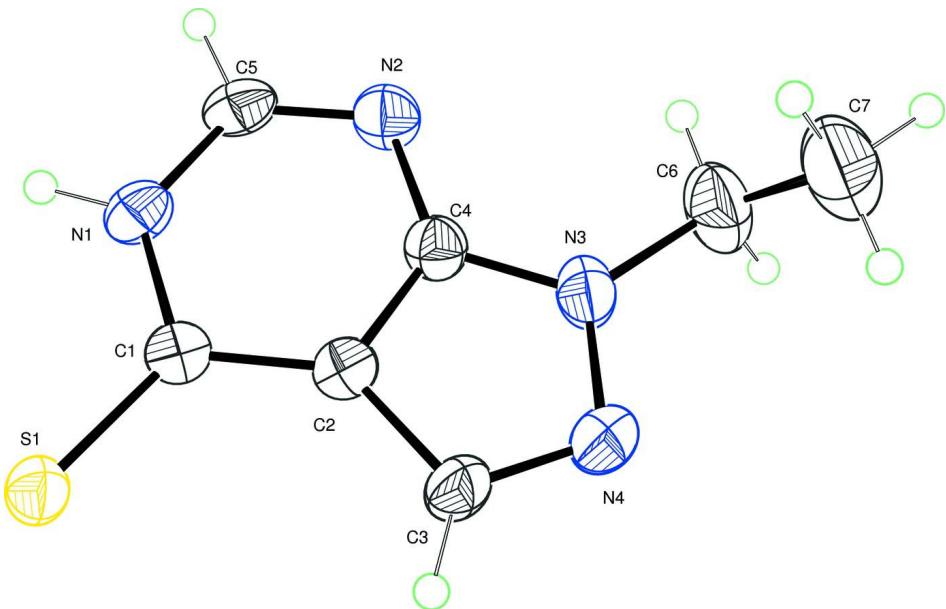

In the crystal, the molecules are linked together by a weak intermolecular N1—H1···S1, C5—H5···S1 and C3—H3···N2 interactions, in the way to build a two-dimensional network (see Fig.2 and Table 1).

### S2. Experimental

(0,54 g, 3.04 mmol) of 1-ethyl-pyrazolo [3, 4 - d] pyrimidin-4 (5*H*)-one and (0,84 g, 3.65 mmol) of phosphorus pentasulfide were refluxed in pyridine for 4 h. Then the solvent is evaporated under reduced pressure; the precipitate formed is washed with hot water and recrystallized from ethanol solution to afford the title compound as yellow blocks.

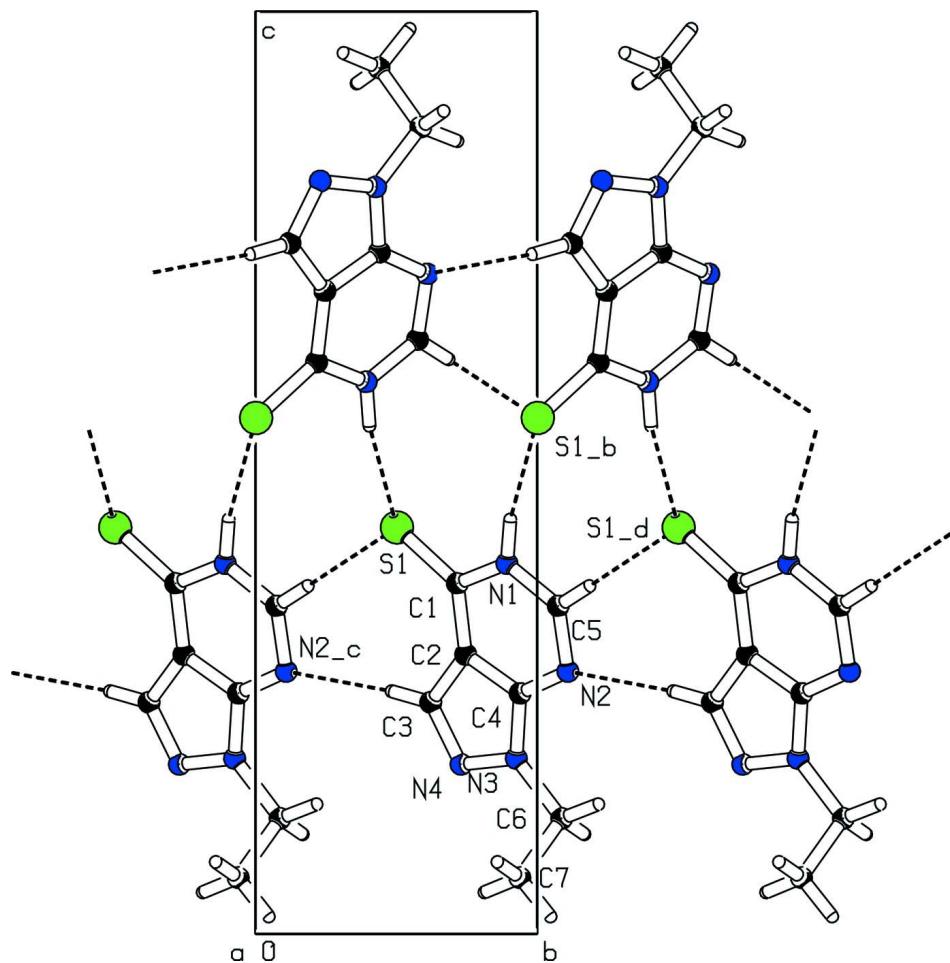

### S3. Refinement

The H atoms were located in a difference map and treated as riding with C—H = 0.93 Å (aromatic), C—H = 0.97 Å (methylene) and C—H = 0.96 Å, (methyl). All hydrogen with  $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}$  (aromatic and methylene) and  $U_{\text{iso}}(\text{H}) = 1.5 U_{\text{eq}}$  for the methyl.

**Figure 1**

Molecular structure of the title compound with displacement ellipsoids drawn at the 50% probability level.

**Figure 2**

Structure projection along  $(0 \ 1 \ 1)$  of the title compound, showing molecules linked through hydrogen bonds (dashed lines).

Hydrogen site location: inferred from neighbouring sites  
 H-atom parameters constrained  
 $w = 1/[\sigma^2(F_o^2) + (0.P)^2]$   
 where  $P = (F_o^2 + 2F_c^2)/3$   
 $(\Delta/\sigma)_{\max} < 0.001$   
 $\Delta\rho_{\max} = 0.29 \text{ e } \text{\AA}^{-3}$   
 $\Delta\rho_{\min} = -0.36 \text{ e } \text{\AA}^{-3}$   
 Absolute structure: Flack & Bernardinelli (2000), 652 Friedel pairs  
 Absolute structure parameter: -0.11 (16)

#### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against all reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on all data will be even larger.
