ENUMERATION OF SYMMETRIC MATRICES

BY HANSRAJ GUPTA

1. **Introduction.** Let $H(n, r)$ denote the number of $n \times n$ matrices $[a_{ij}]$ where the a_{ij} are non-negative integers that satisfy

$$(1.1) \quad \sum_{i=1}^n a_{ij} = r = \sum_{j=1}^n a_{ij}, \quad 1 \leq i, j \leq n.$$

Anand, Dumir and Gupta [1] conjectured that for a given n and any r ,

$$(1.2) \quad H(n, r) = \sum_{t=0}^{\binom{n-1}{2}} c_t \binom{r+n+t-1}{n+2t-1},$$

where the c_t depend on n alone. This would imply that

$$(1.3) \quad \sum_{r=0}^{\infty} H(n, r) x^r = (1-x)^{-(n-1)^2-1} \psi(x),$$

where $\psi(x)$ is a symmetric polynomial in x of degree $(n-1)(n-2)$. It appears that the coefficients in $\psi(x)$ are positive integers. In particular, we have

$$\sum_{r=0}^{\infty} H(1, r) x^r = (1-x)^{-1},$$

$$\sum_{r=0}^{\infty} H(2, r) x^r = (1-x)^{-2},$$

$$\sum_{r=0}^{\infty} H(3, r) x^r = (1-x)^{-5} (1+x+x^2)$$

and probably

$$\sum_{r=0}^{\infty} H(4, r) x^r = (1-x)^{-10} (1+14x+87x^2+148x^3+87x^4+14x^5+x^6).$$

Carlitz [2] has considered the analogous problem for symmetric matrices. Here, we shall be concerned with the case $r=2$, not considered by Carlitz.

2. Let $S(n)$ denote the number of $n \times n$ symmetric matrices $[a_{ij}]$, where the a_{ij} satisfy

$$a_{ij} = a_{ji} = 0, 1 \text{ or } 2; \quad 1 \leq i, j \leq n;$$

and

Received May 1, 1967.

$$\sum_{i=1}^n a_{ij} = 2.$$

With regard to the elements in the first row, we need consider matrices of the following four forms only:

- (i) $a_{11} = 2; a_{1j} = 0, j \neq 1;$
- (ii) $a_{12} = 2; a_{1j} = 0, j \neq 2;$
- (iii) $a_{11} = a_{12} = 1; a_{1j} = 0, j \neq 1, 2;$
- (iv) $a_{12} = a_{13} = 1; a_{1j} = 0, j \neq 2, 3.$

In what follows, to illustrate our points, we shall give only the relevant portions of the matrices under consideration. If we denote the number of matrices of types (i) - (iv), in our set, by $\alpha(n), \beta(n), \gamma(n)$ and $\delta(n)$ respectively; then it is easy to see that

$$(2.1) \quad S(n) = \alpha(n) + (n-1)\{\beta(n) + \gamma(n)\} + \binom{n-1}{2} \delta(n).$$

3. Relations between $\alpha(n), \beta(n), \gamma(n), \delta(n)$ and $S(n)$.

3.1. We readily see that

$$(3.1) \quad \alpha(n) = S(n-1).$$

For removing the first row and the first column from any matrix of type (i), we are left with a desirable matrix with $(n-1)$ rows and as many columns.

3.2. Again, we have

$$(3.2) \quad \beta(n) = S(n-2).$$

For removing the first two rows and the first two columns from any matrix of type (ii), we are left with a desirable matrix with $(n-2)$ rows and an equal number of columns.

3.3. In the case of matrices of the type (iii), we have to consider two subcases:

- (a) When $a_{22} = 1$. The contribution to $\gamma(n)$ in this case is $S(n-2)$.
- (b) When $a_{22} = 0$. Removing the first row and the first column, we are left with a matrix reducible to the form

$$\begin{array}{ccccccc} 0 & 1 & 0 & 0 & 0 & \dots \\ 1 & 0 & 0 & 0 & 0 & \dots \\ 0 & 0 & & & & \\ 0 & 0 & & & & \\ 0 & 0 & & & & \\ \dots & & & & & \end{array}$$

If we replace the zero at the top left corner by 1, this becomes an $(n-1) \times (n-1)$ matrix of type (iii). The contribution to $\gamma(n)$ in this case, therefore, is

ENUN

$(n-2)\gamma(n-1)$. We,
(3.3) $\gamma(n)$

NB

$(n-2)\gamma(n-1)$. We, thus, have

$$(3.3) \quad \gamma(n) = S(n-2) + (n-2)\gamma(n-1).$$

*

3.4. In the case of matrices of type (iv), a number of subcases arise. We consider these and note the contribution to $\delta(n)$ in each case.

(a) When $a_{22} = 1 = a_{33}$. In this case, the matrix is of the form:

$$\begin{array}{ccccccc} 0 & 1 & 1 & 0 & 0 & \dots & \\ 1 & 1 & 0 & 0 & 0 & \dots & \\ 1 & 0 & 1 & 0 & 0 & \dots & \\ 0 & 0 & 0 & & & & \\ 0 & 0 & 0 & & & & \\ \dots & & & & & & \end{array}$$

The contribution to $\delta(n)$ is $S(n-3)$.

(b) When $a_{23} = 1 = a_{32}$. The contribution to $\delta(n)$ is again $S(n-3)$.

(c) When the matrix is reducible to the form:

$$\begin{array}{ccccccc} 0 & 1 & 1 & 0 & 0 & \dots & \\ 1 & 0 & 0 & 1 & 0 & \dots & \\ 1 & 0 & 0 & 1 & 0 & \dots & \\ 0 & 1 & 1 & 0 & 0 & \dots & \\ 0 & 0 & 0 & 0 & & & \\ \dots & & & & & & \end{array}$$

The contribution to $\delta(n)$ is $(n-3)S(n-4)$.

(d) When the matrix is reducible to one of the two forms:

$$\begin{array}{ccccccc} 0 & 1 & 1 & 0 & 0 & \dots & 0 & 1 & 1 & 0 & 0 & \dots \\ 1 & 1 & 0 & 0 & 0 & \dots & 1 & 0 & 0 & 1 & 0 & \dots \\ 1 & 0 & 0 & 1 & 0 & \dots & 1 & 0 & 1 & 0 & 0 & \dots \\ 0 & 0 & 1 & & & & 0 & 1 & 0 & & & \\ 0 & 0 & 0 & & & & 0 & 0 & 0 & & & \\ \dots & & & & & & \dots & & & & & \end{array}$$

Removing the first two or the first and third rows and the same columns, we are left with an $(n-2) \times (n-2)$ matrix of the type:

$$\begin{array}{cccc} 0 & 1 & 0 & \dots \\ 1 & 0 & 0 & \dots \\ 0 & 0 & & \\ \dots & & & \end{array}$$

The contribution to $\delta(n)$ in either case, is $(n-3)\gamma(n-2)$.

(e) Finally, when the matrix is reducible to one of the two forms:

$$\begin{array}{cccccc}
 0 & 1 & 1 & 0 & 0 & 0 \dots \\
 1 & 0 & 0 & 1 & 0 & 0 \dots \\
 1 & 0 & 0 & 0 & 1 & 0 \dots \\
 0 & 1 & 0 & & & \\
 0 & 0 & 1 & & & \\
 0 & 0 & 0 & & & \\
 \dots & & & & &
 \end{array}
 \begin{array}{cccccc}
 0 & 1 & 1 & 0 & 0 & 0 \dots \\
 1 & 0 & 0 & 0 & 1 & 0 \dots \\
 1 & 0 & 0 & 1 & 0 & 0 \dots \\
 0 & 0 & 1 & & & \\
 0 & 1 & 0 & & & \\
 0 & 0 & 0 & & & \\
 \dots & & & & &
 \end{array}$$

The contribution to $\delta(n)$ in either case, is $(n-3)(n-4)/2$ times what it would be from the $(n-2) \times (n-2)$ matrix

$$\begin{array}{cccc}
 0 & 1 & 1 & 0 \dots \\
 1 & & & \\
 1 & & & \\
 0 & & &
 \end{array}$$

It is, therefore, $(n-3)(n-4)\delta(n)/2$ in each case. We, thus, have (3.4) $\delta(n) = 2S(n-3) + (n-3)S(n-4) + 2(n-3)\gamma(n-2) + (n-3)(n-4)\delta(n-2)$, which in view of (3.3),

$$\delta(n) = (n-3)S(n-4) + 2\gamma(n-1) + (n-3)(n-4)\delta(n-2).$$

4. Recursion formulae for $S(n)$ and $\gamma(n)$. The results obtained in §3, can be written:

$$(4.1) \quad S(n) = \gamma(n+2) - n\gamma(n+1),$$

$$(4.2) \quad \delta(n) - (n-3)(n-4)\delta(n-2) = (n-3)S(n-4) + 2\gamma(n-1).$$

Also, from (2.1) and (3.3), we have

$$(4.3) \quad \binom{n-1}{2} \delta(n) = S(n) - (n-1)S(n-2) - \gamma(n+1).$$

Multiplying the two sides of (4.2) by $(n-1)(n-2)/2$, and making use of (4.3), we get

$$\begin{aligned}
 S(n) - (n-1)S(n-2) - \gamma(n+1) - (n-1)(n-2) \\
 \cdot \{S(n-2) - (n-3)S(n-4) - \gamma(n-1)\} \\
 = (1/2)(n-1)(n-2)(n-3)S(n-4) + (n-1)(n-2)\gamma(n-1).
 \end{aligned}$$

Hence

$$\begin{aligned}
 (4.4) \quad \gamma(n+1) = S(n) - (n-1)^2 S(n-2) \\
 + (1/2)(n-1)(n-2)(n-3)S(n-4).
 \end{aligned}$$

From (4.1) and (4.4), we now have

ENUN

$$(4.5) \quad S(n+1) = (n-$$

and

$$(4.6) \quad \gamma(n+2) = (n+1)$$

Since $S(1) = 1 = \gamma(2)$, we

and

$$S(-m) =$$

5. As an analogous problem $1 \leq i, j \leq n$, such that

Defining $\gamma^*(n)$ and $\delta^*(n)$ in sections, we get

$$(5.1) \quad S^*(n) = (n-1)\gamma^*(n)$$

$$(5.2) \quad \gamma^*(n) = S^*(n-2)$$

and

$$(5.3) \quad \delta^*(n) = 2\gamma^*(n-1)$$

Eliminating $\gamma^*(n)$ and $\delta^*(n)$ in the above equations, we get

$$(5.4) \quad S^*(n+1) = n \{ S^*(n-1) - S^*(n-3) \}$$

We take $S^*(0) = 1$ and $S^*(-1) = 0$.

6. Generating functions.

6.1. Let $T(n)$ denote the number of partitions of n into distinct parts, such that

$$(4.5) \quad S(n+1) = (n+1)S(n) + n^2S(n-1) - n(n-1)^2S(n-2) \\ - 3\binom{n}{3}S(n-3) + 12\binom{n}{4}S(n-4);$$

and

$$(4.6) \quad \gamma(n+2) = (n+1)\gamma(n+1) + (n-1)^2\gamma(n) - (n-1)^2(n-2)\gamma(n-1) \\ - 3\binom{n-1}{3}\gamma(n-2) + 12\binom{n-1}{4}\gamma(n-3).$$

Since $S(1) = 1 = \gamma(2)$, we take

$$S(0) = 1 = \gamma(1);$$

and

$$S(-m) = 0 \text{ for } m > 0, \gamma(-m) = 0 \text{ for } m \geq 0.$$

5. As an analogous problem, we find $S^*(n)$, the number of matrices $[a_{ij}]$, $1 \leq i, j \leq n$, such that

$$a_{ij} = a_{ji} = 0 \text{ or } 1,$$

$$\sum_{i=1}^n a_{ii} = 2.$$

Defining $\gamma^*(n)$ and $\delta^*(n)$ in the obvious way, and proceeding as in the preceding sections, we get

$$(5.1) \quad S^*(n) = (n-1)\gamma^*(n) + (1/2)(n-1)(n-2)\delta^*(n);$$

$$(5.2) \quad \gamma^*(n) = S^*(n-2) + (n-2)\gamma^*(n-1);$$

and

$$(5.3) \quad \delta^*(n) = 2\gamma^*(n-1) + (n-3)S^*(n-4) + (n-3)(n-4)\delta^*(n-2).$$

Eliminating $\gamma^*(n)$ and $\delta^*(n)$ from these relations, we obtain without any particular difficulty

$$(5.4) \quad S^*(n+1) = n\left\{S^*(n) + nS^*(n-1) - (n-1)(n-3)S^*(n-2) \right. \\ \left. - \binom{n-1}{2}S^*(n-3) - 3\binom{n-1}{3}S^*(n-4)\right\}.$$

We take $S^*(0) = 1$ and $S^*(-m) = 0$ for $m > 0$.

6. Generating functions.

6.1. Let $T(n)$ denote the number of $n \times n$ symmetric matrices $[a_{ij}]$ which are such that

$$a_{ij} = 0 \text{ or } 1, 1 \leq i, j \leq n,$$

and

$$\sum_{i=1}^n a_{ij} = 1 = \sum_{j=1}^n a_{ij}.$$

Then, as Carlitz has shown,

$$(6.1) \quad h(x) = \sum_{n=0}^{\infty} \frac{T(n)}{n!} x^n = \exp \left(x + \frac{x^2}{2} \right).$$

6.2. Let

$$f(x) = \sum_{n=0}^{\infty} \frac{S(n)}{n!} x^n, \text{ with } f(0) = 1.$$

Then, in view of (4.5), we have

$$(1 - x - x^2 + x^3) f'(x) = (1 + x - x^2 - \frac{1}{2} x^3 + \frac{1}{2} x^4) f(x).$$

This gives

$$(6.2) \quad \frac{f'(x)}{f(x)} = (1 - x^2 + \frac{1}{2} x^3) / (1 - x)^2 = \frac{1}{2} \{ x + (1 - x)^{-1} + (1 - x)^{-2} \}.$$

Hence

$$(6.3) \quad f(x) = (1 - x)^{-\frac{1}{2}} \exp \left(\frac{x^2}{4} + \frac{x}{2(1 - x)} \right).$$

6.3. Let

$$g(x) = \sum_{n=0}^{\infty} \frac{S^*(n)}{n!} x^n, \text{ with } g(0) = 1.$$

Then (5.4) gives

$$(6.4) \quad g(x) = (1 - x)^{-\frac{1}{2}} \exp \left(-\frac{x^2}{4} - x + \frac{x}{2(1 - x)} \right).$$

From (6.1), (6.3) and (6.4), we have the interesting relation:

$$(6.5) \quad f(x) = g(x) h(x);$$

or what is the same thing

$$(6.6) \quad S(n) = \sum_{k=0}^n \binom{n}{k} S^*(n - k) T(k).$$

As a direct consequence of (6.2), we have

$$(6.7) \quad S(n + 1) = (2n + 1)S(n) - \binom{n}{2} [2\{S(n - 1) + S(n - 2)\} - (n - 2)S(n - 3)].$$

Similarly

$$(6.8) \quad S^*(n + 1) = n \{ S(n) + S(n - 1) \}.$$

These formulae are certain
