Computation of Tangent, Euler, and Bernoulli Numbers*

By Donald E. Knuth and Thomas J. Buckholtz

Abstract. Some elementary methods are described which may be used to calculate tangent numbers, Euler numbers, and Bernoulli numbers much more easily and rapidly on electronic computers than the traditional recurrence relations which have been used for over a century. These methods have been used to prepare an accompanying table which extends the existing tables of these numbers. Some theorems about the periodicity of the tangent numbers, which were suggested by the tables, are also proved.

1. Introduction. The tangent numbers T_n , Euler numbers E_n , and Bernoulli numbers B_n , are defined to be the coefficients in the following power series:

$$1 - x/0! + T_1 x/1! + T_2 x^2/2! + \dots = \sum_n T_n x^n/n!,$$

then the coefficient of $z^n/n!$ in $(\tan z)(\cos z)$ is

$$\sum_k \binom{n}{k} T_k C_{n-k}$$

and in $(\sec z)(\cos z)$ it is

$$\sum_k \binom{n}{k} E_k C_{n-k}.$$

Hence, making use of the fact that $T_{2n} = E_{2n+1} = 0$, we have the recurrence re-

$$(4) \quad \binom{2n+1}{1} T_1 - \binom{2n+1}{3} T_3 + \cdots + (-1)^n \binom{2n+1}{2n+1} T_{2n+1} = 1, \quad n \geq 0;$$

$$(5) \quad \binom{2n}{0} E_0 - \binom{2n}{2} E_2 + \cdots + (-1)^n \binom{2n}{2n} E_{2n} = 0, \quad n > 0.$$

large number $T_{n,k}$
In $T_{n,0}$ for odd val

$$T_{n+2,k} =$$

but a count of th

Since $E_n = E_{n+1}$
numbers. A some

large number T_n and $n/2$ additions of large numbers. Since we are interested only

to be retained in the computer memory at any one time. A further technique can be employed when the memory size has been exceeded; for example, suppose we start with the computation of T_{nk} for $n \leq 4$:

(a) Set ar
right.

(b) Store

$n = 3$	2	0	8	0	6	
$n = 4$	0	16	0	40	0	24

and suppose that very little memory space is available, so that we cannot completely evaluate all of the entries for $n = 5$; we might obtain

$n = 5$	16	0	136	0	240	0	*
---------	----	---	-----	---	-----	---	---

where "*" denotes an unknown value. The calculation may still proceed, keeping track of unknown values:

$n = 6$	0	272	0	1232	0	*
$n = 7$	272	0	3968	0	*	

$n = 9$	7936	0	*				etc.
---------	------	---	---	--	--	--	------

In this way we may compute the values of about twice as many tangent numbers

(14) $\begin{array}{|c|} \hline 6 \\ \hline \uparrow \\ Q \\ k = 3 \end{array}$

$$l_c = 2 \quad \Delta = 16 \quad R = 16$$

also has advantages over (10) for the same reason.

It remains to consider the calculation of the Bernoulli number B_n for n

Fo

For $T_{n,k}$ can contribute nothing to any subsequent value of T_n when $k \geq p$.
We will show below that the minimum polynomial equation satisfied by A is

by Kummer make it p

1.2.3.4.5.6.7.8.9.10.11.12.13.14.15.16.17.18.19.20.21.22.23.24.25.26.27.28.29.30.31.32.33.34.35.36.37.38.39.40.41.42.43.44.45.46.47.48.49.50.51.52.53.54.55.56.57.58.59.60.61.62.63.64.65.66.67.68.69.70.71.72.73.74.75.76.77.78.79.80.81.82.83.84.85.86.87.88.89.90.91.92.93.94.95.96.97.98.99.100.

$$+ 4 \cdot 5 \cdot 6 \cdot 7 + 4 \cdot 5 \cdot 7 \cdot 1 + 5 \cdot 6 \cdot 7 \cdot 1$$

(modulo 7). Let us say two terms $a_1(a_1 + 1) \cdots a_k(a_k + 1)$ and $a'_1(a'_1 + 1) \cdots a'_k(a'_k + 1)$ are "equivalent" if, for some r and t and for all j , $a_j \equiv a'_j \pmod{p} + t$; thus, in the above example the terms $1 \cdot 2 \cdot 4 \cdot 5$, $2 \cdot 3 \cdot 5 \cdot 6$, $3 \cdot 4 \cdot 6 \cdot 7$, $4 \cdot 5 \cdot 7 \cdot 1$, $5 \cdot 6 \cdot 1 \cdot 2$, $6 \cdot 7 \cdot 2 \cdot 3$, $7 \cdot 1 \cdot 3 \cdot 4$ are mutually equivalent. It is impossible for a term to be equivalent to itself when $0 < t < p$, since this would imply $a_1 + \cdots + a_k \equiv a_1 + \cdots + a_k + kt$, and $t \equiv 0$. Therefore, each equivalence class has precisely p terms in it. When $k < (p - 1)/2$ the sum over an equivalence class has the form

(34)

(35)

Proof. Assume n

(36)

Kummer's congruence

(37)

 $\Delta^k(2)$

by Kummer make it possible to establish further results about the period-length:

$$(35) \quad E_{n+lp^{k-1}} \equiv E_n \pmod{p^k}, \quad n \geq k.$$

Proof. Assume $n \geq k$ and define the sequence $\langle u_m \rangle$ by the rule

$$(36) \quad u_m = (-1)^{(p-1)m/2} T_{n+(p-1)m}, \quad m \geq 0.$$

Kummer's congruence for the tangent numbers may be written
