

S5 Fig. Normalised gene expression of stromal genes in fetal fibroblasts in the presence of different treatments. Fibroblasts from bovine fetal ovary (n = 5) were cultured with different treatments for 18 h. Fold changes of gene expression to the control groups are presented as mean $\pm$ SEM (normalised to *PPIA* and *RPL32*). Significantly different results among groups were determined by one-way ANOVA with Tukey's post-hoc test.

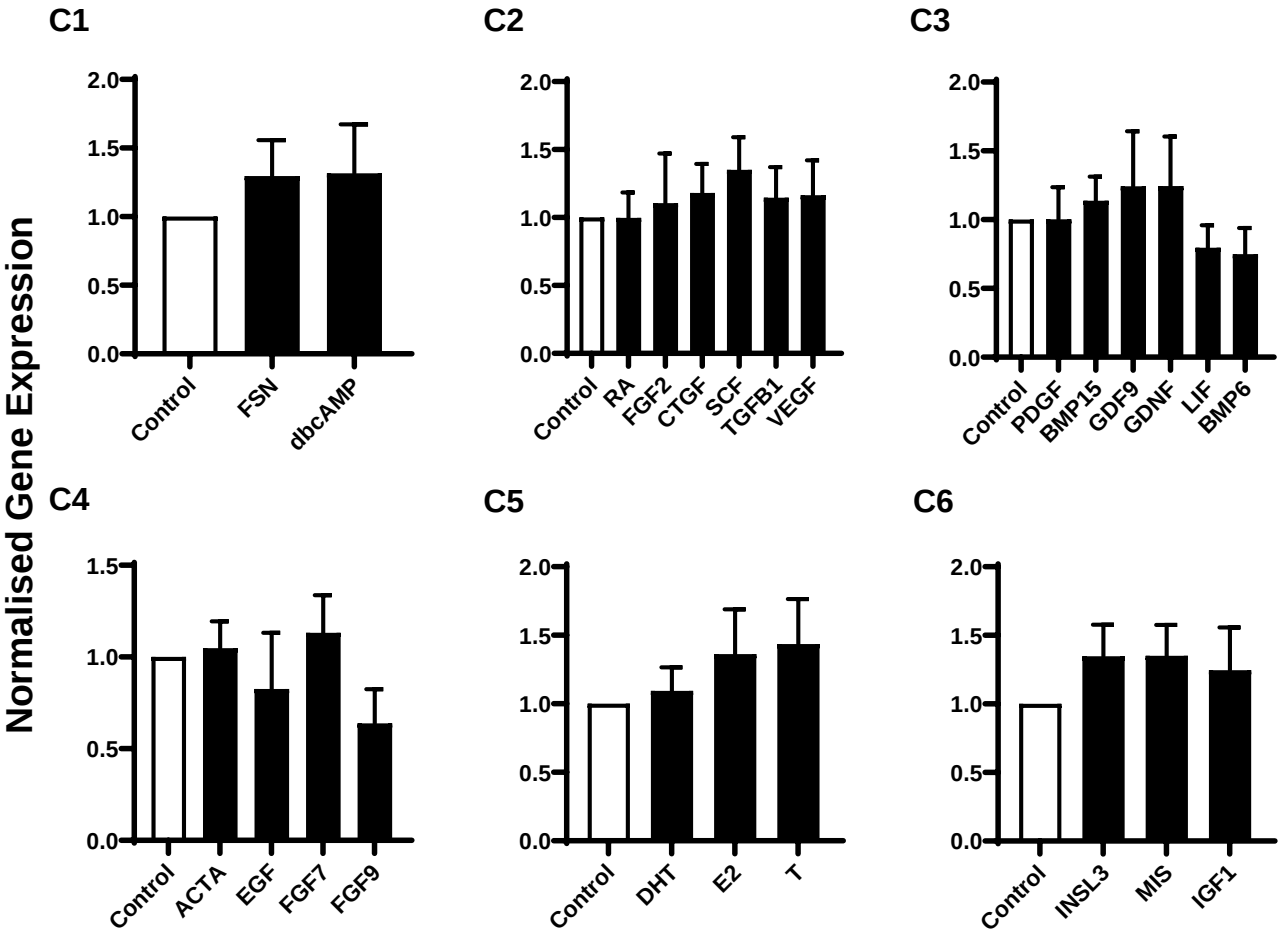

A *NR2F2*

B *FBN1*
